Routine eye examinations do not detect all diseases in their early stages. However, modern technological advances have made it possible to spot subtle vision problems that may be indicative of the beginning states of eye disease. One such device is the Frequency Doubling Technology Visual Field Tester (FDT). This sensitive instrument can detect such diseases as **pituitary tumors, glaucoma, retinal and macular degeneration, optic nerve disease and retinal disturbances due to vascular problems or medications**, even though you may not have noticed any change in your vision.

We recommend that all patients over the age of 18 receive this test. It may be especially important in those patients who have a history of **high blood pressure, diabetes, headaches, migraines, floaters, a high spectacle prescription, retinal problems, or a family history of eye problems.**

Because this is a screening test, FDT is **NOT** covered by your insurance. There is a nominal fee of **\$30.00** for this test, payment of which is your responsibility. **This fee is due at the conclusion of your examination today.**

Please check the appropriate box and sign below:

- I would like a comprehensive eye examination (**including the FDT test**) today.
- I understand the importance of the FDT screening and understand this test is in my best interest, but I prefer the general eye examination only. (Exam does **NOT** include the FDT test.)
